A method and apparatus for domain conversions for multiple channels within a single analog front-end include processing that begins by generating a system clock. The processing continues by converting a frequency of 1st data from a 1st channel frequency to a 2nd channel frequency based on a 1st integer ratio of the system clock. The processing continues by converting the domain of the 1st data rate from a 1^{st} domain to a 2^{nd} domain. The processing continues by converting a frequency of the 2^{nd} data of a 2^{nd} channel from a 2^{nd} channel frequency to the 2^{nd} frequency based on a 2^{nd} integer ratio of the system clock. For example, the rate of the 2^{nd} data may be different than the rate of the 1^{st} but both are converted to the 2nd frequency, which is universally used within the analog front-end. The processing continues by converting the domain of the 2nd data from the 1st domain to the 2nd domain.
